
HTML Tutorial

Ref: <https://www.w3schools.com/> and
other internet based tutorials

HTML The class Attribute

- The HTML class attribute is used to define equal styles for elements with the same class name.
- All HTML elements with the same class attribute will get the same style.
- HTML elements can have more than one class name, each class name must be separated by a space.

eg: `<h2 class="city main">London</h2>`

- JavaScript can access elements with a specified class name by using the `getElementsByClassName()` method:
-

```
<!DOCTYPE html>
<html>
<head>
<style>
.cities {
  background-color: black;
  color: white;
  margin: 20px;
}
</style>
</head>
<body>
<div class="cities">
  <h1>London</h1>
  <p>London is the capital of England.</p>
</div>
<div class="cities">
  <h2>Paris</h2>
  <p>Paris is the capital of France.</p>
</div>
</body>
</html>
```

The id Attribute

- The id attribute specifies a unique id for an HTML element (the value must be unique within the HTML document).
- The id value can be used by CSS and JavaScript to perform certain tasks for the element with the specific id value.

```
<style>
```

```
/* Style the element with the id "myHeader" */
```

```
#myHeader {
```

```
    background-color: lightblue;
```

```
    color: black;
```

```
    padding: 40px;
```

```
    text-align: center;
```

```
}
```

-
- Use of ID attributes in JavaScript
 - In JavaScript, the id attribute is used to manipulate the text, if you want to make changes on a precise element in your script, then you can use id attribute.

```
<script>  
function testresults() {  
    document.getElementById("test").style.color = "black";  
}  
</script>
```

HTML Layouts

- Websites often display content in multiple columns (like a magazine or newspaper).
- HTML offers several semantic elements that define the different parts of a web page:
- There are five different ways to create multicolumn layouts. Each way has its pros and cons:
 - ❑ HTML tables (not recommended)
 - ❑ CSS framework
 - ❑ CSS grid
 - ❑ CSS float property
 - ❑ CSS flexbox
