

Question Bank CSA3004_Big Data Analytics Dr. Kimmi Kumari

- 1** Outline the evolution of Big Data
- 2** List the 5 V'S of Big Data.
- 3** Identify the various daemons of Yarn.
- 4** State Major Applications of Big Data Analytics.
- 5** List any two differences between Peer-to-Peer Distribution Model and Master-Slave Distributed Model.
- 6.** Define MapReduce Framework and its functions.
- 7.** Explain any two HDFS Commands with example
- 8.** Explain the two daemons related to MapReduce.
- 9.** List the steps to read data from HDFS briefly with diagram.
- 10.** Apply the below scenario and give an efficient approach to resolve it. Imagine you're working for a company that needs to understand the web traffic patterns on their site. To do this, you decide to use a sample dataset of web logs. By employing MapReduce, you can efficiently process and analyze this data to uncover insights about user behavior and site performance.
- 11.** Apply the below scenario and implement a MapReduce job that processes these documents to count how many times each word appears across the entire dataset. Imagine you're working on a project where you need to analyze a large collection of text documents to determine the frequency of each word. To handle this efficiently, you decide to use a MapReduce approach. In this scenario, you'll use a sample dataset of text documents.
- 12.** List the steps to write data to HDFS with diagram.
- 13.** Explain the benefits of Rack Awareness with diagram
- 14** Differentiate between traditional data and Big Data (Any 2)
- 15** List the various types of big data
- 16** Identify the responsibilities of Job Tracker.

- 17** Classify the critical responsibilities of the Name Node, and what happens if it fails?
- 18** State how do the various components of HDFS interact to maintain the integrity and availability of data?
- 19** List the different features of Hadoop and give justifications for each.
- 20** Explain DFS and highlights its components.
- 21** Differentiate between HDFS, Map Reduce and Yarn (Any 5)
- 22** Examine how Secondary Name Node serves as the helping node to Name Node
- 23.** Classify the different types of No-SQL. Explain all in details
- 24.** Explain the HDFS architecture with diagram
